PETAM: CHARLES AND FOR CHARLES 
donors of the 'internal' genes of H5N1 viruses in Hong Kong?";

Proc. Natl. Acad. Sci. U.S.A. 96:9363-9367(1999).

-!- FUNCTION: HERMAGCIUTININ IS RESPONSTBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).

-!- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAINS (HAA AND HA2) LINKED BY A DISULFIDE BOND (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -:- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-ribity1-amino-2.4(1H,3H)-pyrimidinedione and L-3,4-dibytochy-2-butanone-4-phosphate via 6,7-dimethy1-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribity1-amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dibydxchy-2-butanone-4-phosphate yielding 6,7-dimethy1-8-(1-D)-ribity1-amino-1-1-CATALYTIC ACTIVITY: 2 6,7-dimethy1-8-(1-D-ribity1)lumazine inboflavin +4-(1-D-ribity1amino)-5-amino-2,6-dibydroxypyrimidine.-1-PATHWAY: Riboflavin biosynthesis; last step.
-:- SIMILARITY: Belongs to the DWRL synthase family.
-:- CAUTION: Ref. 1 strain Mu50 sequence differs from that shown due to

Sensory rhodopsin II transducer (HTR-II) (Methyl-accepting phototaxis
                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                    "The primary structure of sensory rhodopsin II: a member of an additional retinal protein subgroup is coexpressed with its transducer, the halobacterial transducer of rhodopsin II."; Proc. Natl. Acad. Sci. U.S.A. 92:3036-3040(1995).
-!- FUNCTION: TRANSDUCES SIGNALS FROM THE PHOTOTAXIS RECEPTOR SENSORY RHODOPSIN II (SR-II) TO THE FLAGELLAR MOTOR. RESPONDS TO LIGHT CHANGES TRROUGH THE VARIATION OF THE LEVEL OF METHYLATION.
-!- SIMILARITY: Contains 1 methyl-accepting transducer domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

In Virol. 63:3345-332(1989).

J. Virol. 63:3345-332(1989).

- !- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

C. !- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 consistion, Cys or Thr in P1 and Ser or Ala in P1'.

C. !- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA) (N).

C. !- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN CAND MRNA.

"Biosynthesis of riboflavin Lumazine synthase of Escherichia coli.";

"Biosynthesis of riboflavin Lumazine synthase of Escherichia coli.";

"Biosynthesis of riboflavin gynthase is a bifunctional enzyme complex

"Isblo. Chem. 271:33201-33207(1996).

"Catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-

"Tibity1-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-

butanone-4-phosphate via 6,7-dimethy1-8-lumazine. The beta subunit

catalyzes the condensation of 5-amino-6-(1'-D)-ribity1-amino-

2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-

phosphate yielding 6,7-dimethy1-8-lumazine.

"CATALYTIC ACTIVITY: 2 6,7-dimethy1-8-(1-D-ribity1)lumazine =

riboflavin + 4-(1-D-ribity1amino)-5-amino-2,6-dihydroxypyrimidine.

"Iboflavin + 4-(1-D-ribity1amino)-5-amino-2,6-dihydroxypyrimidine.

"Iboflavin + Core of the capaid does not contain alpha subunits.

"SUBUNIT: Oligomer of 60 beta subunits forming an icosahedral

capsid. The core of the capaid does not contain alpha subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. "The topology of the brown adipose tissue mitochondrial uncoupling
protein determined with antibodies against its antigenic sites
revealed by a library of fusion proteins.";
EMBO G. 12:3739-3745(1993).
-!- FUNCTION: UCP ARE MITOCHONDRIAL TRANSPORTER PROTEINS THAT CREAT
PROTON LEAKS ACROSS THE INNER MITOCHONDRIAL MEMBRANE, THUS
UNCOUPLING OXIDATIVE PHOSPHORYLATION PROM ATP SYNTHESIS. AS A
RESULT, ENERGY IS DISSIPATED IN THE FORM OF HEAT.
-!- SUBGELLULAR LOCATION: Integral membrane protein. Mitochondrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       InterPro; IPR002030; Mit_uncoupling.

"Inductional enzyme that catalyzes the formation of 4-diphosphocytidyl-2C-methyl-D-erythritol from CTP and 2C-methyl-D-erythritol 4-phosphate (ispp), and converts 4-diphosphocytidyl-2C-methyl-D-erythritol 2-phosphate into 2C-methyl-D-erythritol 2.4-cyclodiphosphate and CMP (ispP). Also converts 4-diphosphocytidyl-2C-methyl-D-erythritol into 2C-methyl-D-erythritol 3,4-cyclophosphate and CMP (ispP) (By similarity).

-!- CATALYTIC ACTIVITY: CTP + 2-C-methyl-D-erythritol.

-!- CATALYTIC ACTIVITY: 2-phospho-4 (cytidine 5-diphospho)-2-C-methyl-D-erythritol.

-!- CATALYTIC ACTIVITY: 2-phospho-4 (cytidine 5-diphospho)-2-C-methyl-D-erythritol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Multifunctional enzyme; Complete proteome.

4-DIPHOSPHOCYTIDYL-2C-METHYL-D-ERYTHRITOL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -1- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; third step.
-1- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; fifth step.
-1- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE ISPD FAMILY.
-1- SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS TO THE ISPP FAMILY.

-!- FUNCTION: Bifunctional enzyme that catalyzes the formation of 4-
diphosphocytidy1-2C-methy1-D-erythritol from CTP and 2C-methy1-D-
erythritol 4-phosphate (ispD), and converts 4-diphosphocytidy1-2C-
methy1-D-erythritol 2-phosphate into 2C-methy1-D-erythritol 2,4-
cyclodiphosphate and CMP (ispF). Also converts 4-diphosphocytidy1-
2C-methy1-D-erythritol into 2C-methy1-D-erythritol 3,4-
cyclophosphate and CMP (ispF) (By similarity).
-!- CATALYTIC ACTIVITY: CTP + 2-C-methy1-D-erythritol 4-phosphate =
diphosphate + 4 (cytidine 5'-diphospho)-2-C-methy1-D-erythritol.
-!- CATALYTIC ACTIVITY: 2-phospho-4 (cytidine 5'-diphospho)-2-C-
methy1-D-erythritol = 2-C-methy1-D-erythritol 2,4-cyclodiphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transferase; Nucleotidyltransferase; Lyase; Isoprene biosynthesis;
Multifunctional enzyme; Complete proteome.

"Complete genome structure of the nitrogen-fixing symbiotic bacterium
                                                                                                                                                          Science 269:496-512(1995).
-!- CATALYTIC ACTIVITY: (3R)-3-hydroxyacyl-[acyl-carrier protein] +
NADP(+) = 3-0xoacyl-[acyl-carrier protein] + NADPH.
-!- NATHWAY: Fatty acid biosynthesis pathway; first reduction step.
-!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases (SDR) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

--- FUNCTION: DNA PRIMASE IS THE POLYMERASE THAT SYNTHESIZES SMALL
RNA PRIMERS FOR THE OKAZAKI RAGMENTS ON BOTH TENLLATE STRANDS AT
REPLICATION FORKS DURING CHROMOSOMAL DNA SYNTHESIS.
--- COPACTOR: BINDS ONE ZINC ION PER MOLECULE (BY SIMILARITY).

-!-SUBCELDUAR LOCATION: Nuclear; associates with centromeric constitutive heterochromatin (By similarity).
-!-DOMAIN: Although the SET domain contains the active site of enzymatic activity, both pre-SET and post-SET domains are required for methyltransferase activity.
-!-SIMILARITY: BELONGS TO THE HISTONE-LYSINE METHYLTRANSFERASE FAMILY. SUVAR3-9 SUBFAMILY.
-!-SIMILARITY: Contains 1 A.T hook DNA-binding repeat.
-!-SIMILARITY: Contains 1 YDG domain.
-!-SIMILARITY: Contains 1 SET domain.
-!-SIMILARITY: Contains 1 SET domain.
-!-SIMILARITY: Contains 1 Dost-SET domain.
